AFM 1B ERCoCr-C
AFM 1M ERCCoCr-C
AWS/SFA A5.21

AFM 1C ECoCr-C
AWS/SFA A5.13

Description:

AFM #1 Cobalt is designed for applications that require extreme abrasion resistance at elevated temperatures, but where impact resistance is not a consideration.
It has a higher carbon and tungsten content than other cobalt alloys causing the weld deposit to have a higher volume of carbides within its microstructure.
Although the weld deposits of AFM #1 Cobalt are not as "tough" as those of AFM #6 Cobalt, they are much harder and have excellent resistance to solid particle erosion.

Typical Applications:

Seals, rotors, steam turbine parts, mixer blades, extrusion dies, saw blades, rolling mill guides, pump impellers, carbon scrapers, engine crossheads, hydrapulper disc parts.

Chemical Composition Requirements (%):

AFM 6B ERCoCr-A
AFM 6M ERCCoCr-A
AWS/SFA A5.21

AFM 6C ECoCr-A
AWS/SFA A5.13

Description:

AFM #6 Cobalt is our most popular and useful cobalt alloy, offering excellent balance between impact, heat, corrosion and metal-tometal abrasion resistance.
It offers outstanding anti-galling properties, superior high temperature hardness and resistance to cavitation erosion making it perfect to use as valve trim in steam engines or repairing worn machine parts.
It is ideal for many hardsurfacing applications because of its resistance to mechanical and chemical degradation at extreme temperatures.

Typical Applications:

High pressure-high temperature valves, agitators, chain saw bars, digestors, hot oil pump parts, extruder screws, scraper knives, hot trimming dies, hot punches.

Chemical Composition Requirements (%):

AFM 6B ERCoCr-A:

AFM 12B ERCoCr-B
AFM 12M ERCCoCr-B
AWS/SFA A5.21

AFM 12C ECoCr-B
AWS/SFA A5.13

Description:

AFM #12 Cobalt is similar to AFM #6 Cobalt, however **AFM #12 Cobalt** offers greater resistance to hot and cold abrasion at elevated temperatures.
Weld deposits are harder than **AFM #6 Cobalt** deposits because of a higher carbide volume within its microstructure.
It is excellent for abrasion and corrosion resistance, but only moderate impact.
It is commonly used for cutting edges.

Typical Applications:

Tipping saw blades, chipping knives, paper slitters, cutter rolls, drawing dies, turbine blades, impeller pumps, conveyor screws, valve seats, cold working tools.

Chemical Composition Requirements (%):

AFM 12B ERCoCr-B:

AFM 21B ERCoCr-E

AFM 21M ERCCoCr-E

AWS/SFA A5.21

AFM 21C ECoCr-E

AWS/SFA A5.13

Description:

AFM #21 Cobalt offers excellent high temperature strength and stability.
The addition of molybdenum gives it work hardening capability, making AFM #21 Cobalt excellent for hit trimming dies, extrusion dies and hot shears.
It has good anti-galling properties and excellent resistance to cavitation erosion and corrosion thereby making AFM #21 Cobalt an excellent choice for fluid seats.

Typical Applications:

Hot forming dies, hot working tools, pump shafts, high pressure-high temperature valves, valve seats, mixer blades, mill cutters, pump mill screws, gas turbines.

High Chromium-Nickel (Austenitic) Stainless Steels (304, 309, 316, etc.) thick sections only	200 °F ~ 500 °F	Slow-Cool
High Chromium (Martensitic) Stainless Steels (410, 416, 420, etc.) thick sections only	400 °F ~ 600 °F	Maintain at 400° ~ 600°F for 4 hrs. per inch thickness, then reduce heat 90°F per hour till cool
High Chromium (Ferritic) Stainless Steel (430, 442, 446, etc.) thick sections only	200 °F ~ 600 °F	Maintain at 200° ~ 600°F for 4 hrs. per inch thickness, then reduce heat 90°F per hour till cool
High Temperature Nickel Alloys (400, 600, 601, 625, 718, etc.)	200 °F ~ 500 °F	Stress-Relieve

*In many cases, preheating or postheat treatment is not necessary. However, it will reduce the chances of cracking in both the base metal and the weld deposit. The preheat or postheat temperatures will depend upon the carbon content of the base metal. The higher the carbon content – the higher the preheat temperature
